AMENDMENTS TO THE CLAIMS

1-3. (Canceled)

4. (Currently amended) An image recording apparatus for recording on a

recording medium a time division multiplex image signal obtained by subjecting image

signals from a plurality of video cameras to time division multiplexing and having

information relating to the camera numbers of the video cameras respectively

corresponding to fields included therein added thereto, comprising:

a plurality of basic image storage means respectively provided in

correspondence with the camera numbers;

means for storing, for each group of fields assigned the same camera

number which are included in the time division multiplex image signal, image data as

basic image data in the basic image storage means corresponding to the camera

number assigned to the group of fields in a period of a predetermined number of fields

as well as feeding the image data as it is, to the image compression means;

means for finding, with respect to image data for each group of fields

assigned the same camera number which are included in the time division multiplex

image signal, the difference between each of the image data corresponding to the fields

between the field corresponding to the image data which is stored in the basic image

storage means and the field corresponding to the image data which is to be

subsequently stored in the basic image storage means and the basic image data which

has been most newly stored in the basic image storage means, and feeding data

2

representing the obtained difference to the image compression means; and

means for recording on a recording medium each of compressed data for

Application

Application No.: 09/537,755 Attorney Docket No.: 107314.00001 each field which have been compressed by the image compression means, together

with identification information indicating whether the compressed data corresponds to

the basic image data or the difference data and the camera number.

5. (Currently amended) An image reproducing apparatus for reproducing the

data which has been recorded on the recording medium by the image recording

apparatus according to claim 4, comprising:

means for reading the compressed data, the identification information, and

the camera number from the recording medium;

image expansion means for expanding for each field the compressed data

which has been read from the recording medium and returning the expanded

compressed data to the data which has not been compressed by said image

compression means;

means for judging whether the data for each field which has been

expanded by the image expansion means is the basic image data or the difference data

on the basis of the identification information;

means for storing, when the data for each field which has been expanded

by the image expansion means is the basic image data, the basic image data in the

basic image storage means corresponding to the camera number corresponding to the

basic image data as well as outputting the basic image data as it is, as reproduced

image data; and

means for restoring, when the data for each field which has been

expanded by the image expansion means is the difference data, the original image data

on the basis of the difference data and the basic image data which has been most

3

Application No.: 09/537,755

TECH/299318.1

newly stored in the basic image storage means corresponding to the camera number

corresponding to the difference data, and outputting the obtained image data as

reproduced image data.

6. (Currently amended) An image recording/reproducing apparatus

comprising a recording apparatus for recording on a recording medium a time division

multiplex image signal obtained by subjecting image signals from a plurality of video

cameras to time division multiplexing and having information relating to the camera

numbers of the video cameras respectively corresponding to fields included therein

added thereto, and a reproducing apparatus for reproducing the data which has been

recorded on the recording medium, wherein

the recording apparatus comprises

a plurality of basic image storage means respectively provided in

correspondence with the camera numbers,

means for storing, for each group of fields assigned the same camera

number which are included in the time division multiplex image signal, image data as

basic image data in the basic image storage means corresponding to the camera

number assigned to the group of fields in a period of a predetermined number of fields

as well as feeding the image data as it is, to the image compression means,

means for finding, with respect to image data for each group of fields

assigned the same camera number which are included in the time division multiplex

image signal, the difference between each of the image data corresponding to the fields

between the field corresponding to the image data which is stored in the basic image

storage means and the field corresponding to the image data which is to be

4

Application No.: 09/537,755

subsequently stored in the basic image storage means and the basic image data which

has been mostly newly stored in the basic image storage means, and feeding data

representing the obtained difference to the image compression means, and

means for recording on a recording medium each of compressed data for

each field which has been compressed by the image compression means, together with

identification information indicating whether the compressed data corresponds to the

basic image data or the difference data and the camera number, and

the reproducing apparatus comprises

means for reading the compressed data, the identification information, and

the camera number from the recording medium, image expansion means for expanding

for each field the compressed data which has been read from the recording medium

and returning the expanded compressed data to the data which has not been

compressed by said image compression means,

means for judging whether the data for each field which has been

expanded by the image expansion means is the basic image data or the difference data

on the basis of the identification information,

means for storing, when the data for each field which has been expanded

by the image expansion means is the basic image data, the basic image data in the

basic image storage means corresponding to the camera number corresponding to the

basic image data as well as outputting the basic image data as it is, as reproduced

image data, and

means for restoring, when the data for each field which has been

expanded by the image expansion means is the difference data, the original image data

5

Application No.: 09/537,755

on the basis of the difference data and the basic image data which has been most

newly stored in the basic image storage means corresponding to the camera number

corresponding to the difference data, and outputting the obtained image data as

reproduced image data.

7. (Withdrawn) An image recording apparatus for recording on a recording

medium an image signal having a predetermined VBI signal multiplexed on a vertical

blanking period in each of fields included therein, comprising:

AD conversion means for converting the image signal into digital image

data;

VBI separation and coding means for separating for each field VBI data

from the digital image data as well as coding the separated VBI data to produce coded

VBI data:

image data compression means for compressing for each field the image

data from which VBI data has been separated;

coded VBI data addition means for adding to the compressed image data

corresponding to each of the fields which has been obtained by the image data

compression means the coded VBI data corresponding to the field; and

recording means for recording on the recording medium the compressed

image data to which the coded VBI data has been added by the coded VBI data

addition means.

(Withdrawn) The image recording apparatus according to claim 7, 8.

wherein

the VBI separation and coding means comprises a means for separating

6

Application No.: 09/537,755

the VBI data from the image data for each field,

first VBI data compression means for slicing the separated VBI data at a

predetermined level, to compress the VBI data in the bit direction, and

second VBI data compression means for averaging for each

predetermined number of data the compressed VBI data obtained by the first VBI data

compression means, and compressing the averaged compressed VBI data in the time

axis direction.

9. (Withdrawn) An image reproducing apparatus for reproducing the data

which has been recorded on the recording medium by the image recording apparatus

according to claim 7, comprising

means for reading from the recording medium the compressed image data

to which the coded VBI data has been added:

VBI separation and coding means for separating the coded VBI data from

the compressed image data which has been read from the recording medium as well as

decoding the separated coded VBI data, to produce VBI data;

image data expansion means for expanding for each field the compressed

image data from which the coded VBI data has been separated;

VBI data addition means for adding to the image data corresponding to

each of the fields which has been obtained by the image data expansion means the VBI

data corresponding to the field; and

DA conversion means for converting the image data to which the VBI data

has been added by the VBI data addition means into an analog image signal.

10. (Withdrawn) An image recording/reproducing apparatus comprising a

7

Application No.: 09/537,755

recording apparatus for recording on a recording medium an image signal having a

predetermined VBI signal multiplexed on a vertical blanking period in each of fields

included therein, and a reproducing apparatus for reproducing data which has been

recorded on the recording medium, wherein

the recording apparatus comprises

AD conversion means for converting the image signal into digital image

data.

VBI separation and coding means for separating for each field VBI data

from the digital image data as well as coding the separated VBI data to produce coded

VBI data.

image data compression means for compressing for each field the image

data from which the VBI data has been separated,

coded VBI data addition means for adding to the compressed image data

corresponding to each of the fields which has been obtained by the image data

compression means the coded VBI data corresponding to the field, and

recording means for recording on the recording medium the compressed

image data to which the coded VBI data has been added by the coded VBI data

addition means, and

the reproducing apparatus comprises

means for reading from the recording medium the compressed image data

to which the coded VBI data has been added.

VBI separation and coding means for separating the coded VBI data from

the compressed image data which has been read from the recoding medium as well as

8

Application No.: 09/537,755

decoding the separated coded VBI data, to produce VBI data,

image data expansion means for expanding for each field the compressed

image data from which the coded VBI data has been separated.

VBI data addition means for adding to the image data corresponding to

each of the fields which has been obtained by the image data expansion means the VBI

data corresponding to the field, and

DA conversion means for converting the image data to which the VBI data

has been added by the VBI data addition means into an analog image signal.

11. (Withdrawn) The image reproducing apparatus according to claim 10,

wherein

the VBI separation and coding means comprises means for separating the

VBI data from the image data for each field,

first VBI data compression means for slicing the separated VBI data at a

predetermined level, to compress the VBI data in the bit direction, and

second VBI data compression means for averaging for each

predetermined number of data the compressed VBI data obtained by the first VBI data

compression means, and compressing the averaged compressed VBI data in the time

axis direction.

12. A read data error detecting method in an image (Withdrawn)

recording/reproducing apparatus for reading, at the time of play, data for each block

including a plurality of fields from a recording medium to store the data in a memory,

and then successively reading out the data in the block from the memory to perform

play processing, wherein

9

Application No.: 09/537,755

the data for each field which is recorded on the recording medium includes

a frame header which is inserted into a position at the head of the data corresponding to

the field, at least one error detecting header which is inserted into a position spaced a

predetermined number of words apart from the frame header and/or a position where

the number of words from the frame header can be previously specified before data at

the position is stored in the memory, and an end code which is inserted into the final

position of the data corresponding to the field, and further comprising the step of

confirming the frame header from the data read from the recording

medium when the data read from the recording medium is stored in the memory at the

time of play, starting, when the frame header is detected, to count the number of words,

confirming, when the counted number of words corresponds to the position where the

predetermined error detecting header is inserted, whether or not the error detecting

header exists, and judging that an error occurred if the error detecting header cannot be

confirmed.

13. (Withdrawn) The read data error detecting method in the image

recording/reproducing apparatus according to claim 12, further comprising the steps of

returning, when it is judged that the error occurred, a pointer to an address

in the memory into which an end code in the field preceding the field where it is judged

that the error occurred is written, stopping, until a frame header in the field succeeding

the field where it is judged that the error occurred is sent, the writing of data into the

memory, and starting, when a frame header in the field succeeding the field where it is

judged that the error occurred, to write the data corresponding to the field upon

advancing the pointer by one position.
